(54) LIQUID CRYSTAL DISPLAY DEVICE

(57)Abstract:

PROBLEM TO BE SOLVED: To make it possible to improve the brightness of a liquid crystal display device and to control a color temperature of white color independently of three primary colors.

SOLUTION: Relating to a liquid crystal display device holding a liquid crystal composition between a pair of substrates, having color filters different in color phase for displaying in color on one of the substrate pair, and having switching elements for selecting picture elements on the other substrate, a picture element composing on dot for the above color display is constituted of the unit picture elements 1R, 1G, 1B, and 1W. And, the color filters R, G, B corresponding to the three primary colors corresponding to the areas of the three of these four unit picture elements on the above other substrate are arranged on the above-mentioned one substrate, and a color filter W corresponding to white is arranged in the area corresponding to another unit picture element 1W.
